L29 ANSWER 1 OF 41 HCAPLUS COPYRIGHT 2006 ACS on STN
ACCESSION NUMBER: 2006:252468 HCAPLUS
TITLE: Modified electrodes prepared from ferrocene
functionalized silicate xerogels: analysis of
the electrochemical response in isotropic and
fractal structural systems
AUTHOR(S): Audebert, P.; Miomandre, F.; Sallard, S.

AB New xerogels functionalized by ferrocenes as redox probes were
prepd. using various types of catalysis. The anal. of the
electrochem. response in the case of modified electrodes allows the
authors to get an insight into the gel nanostructure which is
isotropic in the case of acidic catalysis, and fractal in the case
of fluoride catalysis, provided that the amt. of functionalized
silanes is not too high. Indeed the results of electrochem.
measurement prove that the fractality of functionalized hybrid SiO₂
is general in the case of basic catalysis, except in the case of
very high functional moieties loading, where the electrode become
essentially org. and isotropic. However, in the case of acidic
catalysis, whatever the amt. of org. material, the hybrid gel
remains isotropic, and a classical electron pseudo-diffusive
behavior is obsd. The diffusion coeff. values extd. from the
current-time slopes do not vary monotonically with the amt. of redox
probe in the case of fractal xerogel structures, which is indicative
that not all the functional moieties are electroactive in that case.
